

AI FOR MANUFACTURING

Moving from predictive maintenance to prescriptive action

DataProphet's AI Suite works in tandem across the production line in order to deliver a holistic view of a production system:

- ◆ DataProphet CONNECT collects data from multiple machines and sensors in the production line and interprets the data onsite.
- ◆ DataProphet DETECT expertly recommends corrective actions as-and-when faults or abnormal operative conditions occur.
- ◆ DataProphet PRESCRIBE provides pre-emptive changes to production processes in order to reduce non-quality, waste and many other measures of process inefficiency.

What makes DataProphet Unique?

Manufacturing plants are dynamic environments. They change quicker than the insights - generated from data - can be determined. DataProphet's Expert Execution System overcomes this problem by providing actionable prescriptions directly to the operational level where they can be acted upon by plant personnel.

Why choose DataProphet?

DataProphet's AI solutions leverage your machine data to deliver expert guidance to quickly improve your production KPIs, with a guaranteed ROI in the first year of operation.

DataProphet's AI Suite

DataProphet PRESCRIBE

DataProphet PRESCRIBE uses state-of-the-art deep learning algorithms to learn and leverage complex parameter interactions, providing more effective and nuanced prescriptions that can be easily put into action by operators.

DataProphet DETECT

DataProphet DETECT monitors your equipment in real-time to immediately identify any deviations from usual operating patterns. The system isolates the causes and provides real-time expert feedback on corrective actions using a company-wide expert knowledge database.

DataProphet CONNECT

DataProphet CONNECT, an Industrial Internet of Things (IIoT) solution, offers manufacturers a complete solution designed by AI experts, including: purpose-built industrial edge devices that collect and interpret data on-site; cloud-native storage and durable data management; and intelligent real-time dashboarding.

Features of DataProphet's AI suite

Data Security

Client manufacturing and application data is housed in fully isolated databases for maximum security.

Prescriptive Guidance

Guidance is provided to operators on important process changes that need to be prioritized in the plant alongside rich data summaries.

Increased OEE

Increases production capacity, reduces production cost, and maximises process tolerances.

Data Ingestion

Process and quality control information from databases, spreadsheets, sensors, and PLC sources can all be ingested and integrated by our platform.

Reduce Defects

>40% reduction in quality defects, which results in the reduction of non-quality costs & rework.

Seamless Integration

Readily adapts to the client's manufacturing environment as our team performs the integration across all common platforms and floor management systems.

8-12 Week deployment period

Implementation can be done remotely and takes just 8-12 weeks with no internal data science skills needed.
